- **Microsoft Certificate of Authenticity**—Contains the Microsoft Windows Product Key. You may need the Product Key to update or troubleshoot the operating system. This certificate is affixed to the bottom of the computer.

- **Regulatory label**—Provides regulatory information about the computer. The regulatory label is affixed inside the memory module compartment.

- **Modem approval label**—Provides regulatory information about the modem and lists the agency approval markings required by some of the countries in which the modem has been approved for use. You may need this information when traveling internationally. The modem approval label is affixed inside the memory module compartment.

- **Wireless certification labels**—Provide information about optional wireless devices available on select models, and the approval markings of some of the countries in which the devices have been approved for use. An optional device may be a wireless local area network (WLAN) device or an optional Bluetooth® device. If the computer model includes one or more wireless devices, a certification label is included with the computer. You may need this information when traveling internationally. Wireless certification labels are affixed inside the memory module compartment.

*This table describes default settings. To view and change TouchPad preferences, select Start > Control Panel > Printers and Other Hardware > Mouse.
Using the TouchPad

To move the pointer, slide your finger across the TouchPad surface in the direction you want the pointer to go. Use the left and right TouchPad buttons as you would the left and right buttons on an external mouse. To scroll up and down using the TouchPad scroll zone, slide your finger up or down over the grooved lines on the TouchPad.

Using an external mouse

An external USB mouse can be connected to the computer using one of the USB ports on the computer. A USB mouse can also be connected to the system using the connectors on an optional expansion product.

Setting TouchPad preferences

Mouse Properties in Microsoft® Windows® allows you to customize settings for pointing devices, including

- TouchPad tapping, which enables you to tap the TouchPad once to select an object or twice to double-click an object (enabled by default).
- Edge motion, which enables you to continue to scroll even though your finger has reached the edge of the TouchPad (disabled by default).
- Button preference, which allows you to switch between left-hand and right-hand use (right-hand preference is enabled by default).

Other features, such as mouse speed preferences and mouse trails, are also found in Mouse Properties.

To access Mouse Properties, select Start > Control Panel > Printers and Other Hardware > Mouse.
The following sections provide information on the keyboard features of the notebook.

### Hotkeys

Hotkeys are combinations of the fn key (1) and either the esc key (2) or one of the function keys (3).

The icons on the f1 through f12 keys represent the hotkey functions. Hotkey functions and procedures are discussed in the following sections.

\textbf{NOTE} Composite video devices can be connected to the system only by using an optional expansion product.

Initiate standby (fn+f5)

Press \texttt{fn+f5} to initiate standby.

When standby is initiated, your information is stored in random access memory (RAM), the screen is cleared, and power is conserved. While the computer is in standby, the power light blinks.

\textbf{CAUTION} To reduce the risk of information loss, save your work before initiating standby.

The computer must be turned on before you initiate standby. If the computer is in hibernation, you must restore from hibernation before you can initiate standby.

\textbf{NOTE} To restore from hibernation, briefly press the power button.

To resume from standby, briefly press the power button, use the TouchPad, press any key on the keyboard, or press the Media button, DVD button, or a TouchPad button.

The function of the \texttt{fn+f5} hotkey can be changed. For example, you can set the \texttt{fn+f5} hotkey to initiate hibernation instead of standby.

\textbf{NOTE} In all Windows operating system windows, references to the \textit{sleep button} apply to the \texttt{fn+f5} hotkey.
Initiate QuickLock (fn+f6)

Press fn+f6 to initiate the QuickLock security feature.

QuickLock protects your information by displaying the operating system Log On window. While the Log On window is displayed, the computer cannot be accessed until a Windows user password or a Windows administrator password is entered.

**NOTE** Before you can use QuickLock, you must set a Windows user password or a Windows administrator password. For instructions, refer to the Help and Support Center.

To use QuickLock, press fn+f6 to display the Log On window and lock the computer. Then follow the instructions on the screen to enter your Windows user password or your Windows administrator password and access the computer.

Using the embedded numeric keypad

The 15 keys of the embedded numeric keypad can be used like the keys on an external keypad. When the embedded numeric keypad is turned on, each key on the keypad performs the function indicated by the icon in the upper-right corner of the key.

Enabling and disabling the embedded numeric keypad

Press fn+num lk to enable the embedded numeric keypad. The num lock light is turned on. Press fn+num lk again to return the keys to their standard keyboard functions.

NOTE The embedded numeric keypad will not function while an external keyboard or keypad is connected to the computer or to an optional expansion product.
Switching key functions on the embedded numeric keypad

You can temporarily alternate the functions of keys on the embedded numeric keypad between their standard keyboard functions and their keypad functions by using the fn key or the fn+shift key combination.

- To change the function of a keypad key to keypad functions while the keypad is off, press and hold the fn key while pressing the keypad key.
- To use the keypad keys temporarily as standard keys while the keypad is on:
  - Press and hold the fn key to type in lowercase.
  - Press and hold fn+shift to type in uppercase.

Using an external numeric keypad

Most keys on most external keypads function differently according to whether num lock mode is on or off. (By default num lock mode is off.) For example:

- When num lock is on, most keypad keys type numbers.
- When num lock is off, most keypad keys function like the arrow, page up, or page down keys.

When num lock on an external keypad is turned on, the num lock light on the computer is turned on. When num lock on an external keypad is turned off, the num lock light on the computer is turned off.

If an external keypad is connected, the embedded numeric keypad cannot be turned on.

Enabling or disabling num lock mode as you work

To turn num lock on or off on an external keypad as you work, press the num lk key on the external keypad, not on the computer.

</tbody>
</table>
Connecting the AC adapter

**WARNING!** To reduce the risk of electric shock or damage to the equipment:

Plug the power cord into an AC outlet that is easily accessible at all times.

Disconnect power from the computer by unplugging the power cord from the AC outlet (not by unplugging the power cord from the computer).

If provided with a 3-pin attachment plug on the power cord, plug the cord into a grounded (earthed) 3-pin outlet. Do not disable the power cord grounding pin; for example, by attaching a 2-pin adapter. The grounding pin is an important safety feature. It is possible to receive an electric shock from a system that is not properly grounded.

To connect the computer to external AC power:

1. Plug the AC adapter into the power connector on the computer (1).
2. Plug the power cord into the AC adapter (2).
3. Plug the other end of the power cord into an AC outlet (3).
Standby and hibernation

Standby and hibernation are energy-saving features that conserve power and reduce startup time. They can be initiated by you or by the system. For more information, refer to "Initiating standby, hibernation or shutdown."

Standby

CAUTION To avoid a complete battery discharge, do not leave the computer in standby for extended periods. Connect the computer to an external power source.

Standby reduces power to system components that are not in use. When standby is initiated, your work is stored in random access memory (RAM), and then the screen is cleared. When the computer is in standby, the power lights blink. When you resume from standby, your work returns to the screen where you left off.

CAUTION To reduce the risk of information loss, save your work before initiating standby.

Hibernation

CAUTION If the configuration of the computer is changed during hibernation, resuming from hibernation may not be possible. When the computer is in hibernation:

- Do not connect the computer to or disconnect the computer from an expansion product.
- Do not add or remove memory modules.
- Do not insert or remove any hard drives or optical drives.
- Do not connect or disconnect external devices.
- Do not insert or remove an external media card, such as a MultiMediaCard, a PC Card (select models only), or an ExpressCard.

Hibernation saves your work to a hibernation file on the hard drive, and then shuts down the computer. The power lights are turned off. When you restore from hibernation, your work returns to the screen where you left off. If a power-on password has been set, the password must be entered to restore from hibernation.

CAUTION To reduce the risk of information loss, save your work before initiating hibernation.

You can disable hibernation. However, if hibernation is disabled and the system reaches a low-battery condition, the system will not automatically save your work while power is on or when standby has been initiated.

Use Power Options in Microsoft® Windows® Control Panel to reenable hibernation:

2. Be sure that the Enable hibernation check box is selected.
To set the time interval after which the system initiates hibernation:

2. Click one of the intervals in the System hibernates list.

**Initiating standby, hibernation or shutdown**

The following sections explain when to initiate standby or hibernation and when to shut down the computer.

---

**NOTE** You cannot initiate any type of networking communications or perform any computer functions while the computer is in standby or hibernation.

---

**When you leave your work**

When standby is initiated, your work is stored in random access memory (RAM), and then the screen is cleared. When the computer is in standby, it uses less power than when it is on. Your work returns instantly to the screen when you resume from standby.

Hibernation saves your work to a hibernation file on the hard drive, and then shuts down the computer. When the computer is in hibernation, it uses much less power than when it is in standby.

When the computer will be unused and disconnected from external power for an extended period, shut down the computer and remove the battery pack to extend the life of the battery pack. For details on battery pack storage, refer to "Storing a battery pack."

**When a reliable power supply is unavailable**

Be sure that hibernation remains enabled, especially if you are operating the computer on battery power and do not have access to an external power supply. If the battery pack fails, hibernation saves your work to a hibernation file and shuts down the computer.

It is recommended that if you pause your work when the power supply is uncertain, you take one of the following actions:

- Save your work, and then initiate standby.
- Initiate hibernation.
- Shut down the computer.
When using wireless communication or readable or writable media (select models only)

CAUTION   To prevent possible audio and video degradation, or loss of audio or video playback functionality, do not initiate standby or hibernation while reading or writing to a CD, DVD, or external media card. To prevent loss of information, do not initiate standby or hibernation while writing to a CD, DVD, or external media card.

Standby and hibernation interfere with the use of infrared and Bluetooth communication, and media. Note the following guidelines:

- If the computer is in standby or hibernation, you cannot initiate an infrared or Bluetooth transmission.
- If standby or hibernation is accidentally initiated during playback of a medium such as a CD, DVD, or external media card
  - Your playback may be interrupted.
  - You may see the following warning message: “Putting the computer into hibernation or standby may stop the playback. Do you want to continue?” Click No.
- You may need to restart the media to resume audio and video playback.
Default power settings

This section explains the default standby, hibernation, and shutdown procedures. For information about changing the function of the power features on the computer, refer to "Power options."

The controls and lights discussed in this section are illustrated in "Power control and light locations."

*If the system initiated hibernation because of a critical low-battery condition, connect external power or insert a charged battery pack before you press the power button. (The system may not respond if the discharged battery pack is the only power source.)
Power options

You can change many default power settings in Windows Control Panel. For example, you can set an audio alert to warn you when the battery pack reaches a low-power condition, or you can change the default settings for the power button.

By default, when the computer is on:

- Pressing the fn+f5 hotkey, called the "sleep button" by the operating system, initiates standby.
- By default, the display switch turns off the display and initiates standby. The display switch is activated by closing the display.

Accessing Power Options Properties

To access Power Options Properties:

- Right-click the Power Meter icon in the notification area, at the far right of the taskbar, and then click Adjust Power Properties.

  – or –

- Select Start > Control Panel > Performance and Maintenance > Power Options.

Displaying the Power Meter icon

By default, the Power Meter icon appears in the notification area, at the far right of the taskbar. The icon changes shape to indicate whether the computer is running on battery or external power.

To show the Power Meter icon in the notification area:

2. Click the Advanced tab.
3. Select the Always show icon on the taskbar check box.
4. Click Apply and then click OK.

To remove the Power Meter icon from the notification area:

1. Right-click the Power Meter icon in the notification area, and then click Adjust Power Properties.
2. Click the Advanced tab.
3. Clear the Always show icon on the taskbar check box.
4. Click Apply and then click OK.

NOTE If you cannot see an icon you have placed in the notification area, at the far right of the taskbar, click the arrow in the notification area to view hidden icons.
Setting or changing a power scheme

The Power Schemes tab in the Power Options Properties dialog box assigns power levels to system components. You can assign different schemes, depending on whether the computer is running on battery or external power.

You can also set a power scheme that initiates standby or turns off the display or hard drive after a time interval that you specify.

To set a power scheme:

1. Right-click the Power Meter icon in the notification area, and then click Adjust Power Properties.
2. Click the Power Schemes tab.
3. Select the power scheme you want to modify, and adjust options in the lists on the screen.
4. Click Apply.

Setting a security prompt

You can add a security feature that prompts you for a password when the computer is turned on, resumes from standby, or restores from hibernation.

To set a password prompt:

1. Right-click the Power Meter icon in the notification area, and then click Adjust Power Properties.
2. Click the Advanced tab.
3. Select the Prompt for password when computer resumes from standby check box.
4. Click Apply.
Processor performance controls

**CAUTION**  To prevent overheating, do not obstruct vents. Use the computer only on a hard, flat surface. Do not allow another hard surface, such as a printer, or a soft surface, such as pillows, thick rugs, or clothing, to block the airflow. Overheating can damage the computer and reduce processor performance.

**NOTE**  In some cases, a computer may operate at a higher speed on external power than on battery power. If the battery power is extremely low, the computer may attempt to conserve power by reducing processor speed and graphics performance.

Windows XP enables you to manage the processor performance controls by selecting a power scheme. The processing speed can be set for optimal performance or for optimal power conservation.

Processor performance controls are managed in the **Power Options Properties** dialog box. To access Windows XP processor performance controls, Select **Start > Control Panel > Performance and Maintenance > Power Options > Power Schemes** tab.

The power scheme you select determines how the processor performs when the computer is plugged into external power or is running on battery power. Each power scheme for external power or battery power sets a specific processor state.

After a power scheme has been set, no other intervention is required to control the performance of the computer processor. The following table describes the processor performance on external and battery power for the available power schemes.

Battery packs

When a charged battery pack is in the computer and the computer is not plugged into external power, the computer runs on battery power. When the computer is plugged into external AC power, the computer runs on AC power.

If the computer contains a charged battery pack and is running on external AC power supplied through the AC adapter, the computer switches to battery power if the AC adapter is disconnected from the computer.

You can keep a battery pack in the computer or in storage, depending on how you work. Keeping the battery pack in the computer whenever the computer is plugged into external AC power enables the battery pack to charge and also protects your work in case of a power outage. However, a battery pack in the computer slowly discharges when the computer is turned off and not plugged into external power.

Inserting or removing a battery pack

⚠️ CAUTION To prevent loss of information when removing a battery pack that is the sole power source, initiate hibernation or turn off the computer before removing the battery pack.

To insert a battery pack:

- **NOTE** Battery packs may vary in appearance.

1. Turn the computer upside down on a flat surface with the battery bay to the left.
2. Insert the battery pack into the battery bay (1) and rotate it until it is seated (2).

   The battery pack release latch automatically locks the battery into place.
To remove a battery pack:

1. Turn the computer upside down with the battery bay to the left.
2. Slide the battery pack release latch (1) to release the battery pack.
3. Pivot the battery pack (2) away from the computer and remove it from the computer (3).

Charging a battery pack

To prolong battery life and optimize the accuracy of battery charge displays:

⚠️ **WARNING!** Do not charge the computer battery pack on board aircraft. Charging the battery pack may damage aircraft electronic systems.

- If you are charging a new battery pack:
  - Charge the battery pack while the computer is connected to external power through the AC adapter.
  - When you charge the battery pack, charge it fully before turning on the computer.

- If you are charging an in-use battery pack:
  - Allow the battery pack to discharge to about 10 percent of a full charge through normal use before charging it.
  - When you charge the battery pack, charge it fully before turning on the computer.

A battery pack inserted in the computer charges whenever the computer is connected to external power through an AC adapter, an optional expansion product, or an optional power adapter.

A battery pack inserted in the computer charges whether the computer is off or in use, but the battery pack charges faster while the computer is off. Charging may be delayed if a battery pack is new, has been unused for 2 weeks or more, or is much warmer or cooler than room temperature.
The battery light displays charge status:

- On: the battery pack is charging.
- Blinking: the battery pack has reached a low-battery condition and is not charging.
- Blinking rapidly: The battery pack has reached a critical low-battery condition and is not charging.
- Off: the battery pack is fully charged or not installed.

For information about determining the amount of charge in a battery pack, refer to "Monitoring the charge of the battery pack."

**Monitoring the charge of the battery pack**

This section explains several ways to determine the amount of charge in a battery pack.

**Obtaining accurate charge information**

To increase the accuracy of all battery charge indicators:

- Allow a battery pack to discharge to about 10 percent of a full charge through normal use before charging it.
- When you charge a battery pack, charge it fully before turning on the computer.
- If a battery pack has been unused for one month or more, calibrate the battery pack instead of simply charging it. For calibration instructions, refer to "Calibrating a battery pack."

**Displaying charge information on the screen**

This section explains how to access and interpret battery charge indicators.

**Viewing charge displays**

To view information about the status of any battery pack in the computer:

- Double-click the **Power Meter** icon in the notification area, at the far right of the taskbar.
- or –

  - Select **Start > Control Panel > Performance and Maintenance > Power Options > Power Meter**.

**Interpreting charge indicators**

Most charge indicators report battery status as both a percentage and as the number of minutes of charge remaining:

- The percentage indicates the approximate amount of charge remaining in the battery pack.
- The time indicates the approximate running time remaining on the battery pack if the battery pack continues to provide power at the current level. For example, the time remaining will decrease when you start playing a DVD and will increase when you stop playing a DVD.

When a battery pack is charging, a lightning bolt icon may be superimposed over the battery icon on the Power Meter screen.
Managing low-battery conditions

The information in this section describes the alerts and system responses set at the factory. Some low-battery condition alerts and system responses can be changed using Power Options in Windows Control Panel. Preferences set using Power Options do not affect lights.

Identifying low-battery conditions

This section explains how to identify low-battery and critical low-battery conditions.

Low-battery condition

When a battery pack that is the sole power source for the computer reaches a low-battery condition, the battery light blinks.

Critical low-battery condition

If a low-battery condition is not resolved, the computer enters a critical low-battery condition, and the battery light blinks rapidly.

In a critical low-battery condition:

- If hibernation is enabled and the computer is on or in standby, the computer initiates hibernation.
- If hibernation is disabled and the computer is on or in standby, the computer remains briefly in standby, and then shuts down and loses any unsaved information.

To verify that hibernation is enabled:

1. Select **Start > Control Panel > Performance and Maintenance > Power Options > Hibernate**.
2. Be sure that the **Enable hibernation support** check box is selected.
Resolving low-battery conditions

CAUTION  To reduce the risk of losing information when the computer reaches a critical low-battery condition and has initiated hibernation, do not restore power until the power lights are turned off.

When external power is available
To resolve a low-battery condition when external power is available, connect one of the following adapters:

- AC adapter
- Optional expansion product
- Optional power adapter

When a charged battery pack is available
To resolve a low-battery condition when a charged battery pack is available:

1. Turn off the computer or initiate hibernation.
2. Insert a charged battery pack.
3. Turn on the computer.

When no power source is available
To resolve a low-battery condition when no power source is available:

- Initiate hibernation.
  - or –
- Save your work and shut down the computer.

When the computer cannot restore from hibernation
To resolve a low-battery condition when the computer lacks the power to restore from hibernation:

1. Insert a charged battery pack or plug the computer into external power.
2. Restore from hibernation by pressing the power button.
Calibrating a battery pack

When to calibrate

Even if a battery pack is heavily used, it should not be necessary to calibrate it more than once a month. It is not necessary to calibrate a new battery pack. Calibrate a battery pack under the following conditions:

- When battery charge displays seem inaccurate
- When you observe a significant change in battery run time
- When the battery pack has been unused for one month or more

How to calibrate

Three steps are involved in calibrating a battery pack: fully charging, fully discharging, and then fully recharging.

Step 1: Charging the battery pack

A battery pack can charge whether the computer is off or in use, but it will charge faster when the computer is off.

⚠️ WARNING! Do not charge the computer battery pack on board aircraft. Charging the battery pack may damage aircraft electronic systems.

To charge the battery pack:

1. Insert the battery pack into the computer.
2. Connect the computer to an AC adapter, optional power adapter, or optional expansion product, and then plug the adapter or device into external power.
   
   The battery light on the computer is turned on.
3. Leave the computer plugged into external power until the battery pack is fully charged.
   
   The battery light on the computer is turned off.
Step 2: Discharging the battery pack

Before you begin a full discharge, disable hibernation.

To disable hibernation:

1. Select **Start > Control Panel > Performance and Maintenance > Power Options > Hibernate**.
2. Clear the **Enable hibernation** check box.
3. Click **Apply**.

The computer must remain on while the battery pack is being discharged. The battery pack can discharge whether or not you are using the computer but will discharge faster while the computer is in use.

- If you plan to leave the computer unattended during the discharge, save your information before beginning the discharge procedure.
- If you use the computer occasionally during the discharge procedure and have set energy-saving timeouts, expect the following performance from the system during the discharge process:
  - The monitor will not turn off automatically.
  - Hard drive speed will not decrease automatically when the computer is idle.
  - System-initiated hibernation will not occur.

To fully discharge a battery pack:

1. Right-click the **Power Meter** icon in the notification area, at the far right of the taskbar, and then click **Adjust Power Properties**.
   - or –
   Access the Power Schemes tab by selecting **Start > Control Panel > Performance and Maintenance > Power Options > Power Schemes** tab.
2. Record the 4 settings listed in the **Running on batteries** and **Plugged In** columns so that you can reset them after the calibration.
3. Set the 4 options to **Never**.
4. Click **OK**.
5. Disconnect the computer from its external power source, but do **not** turn off the computer.
6. Run the computer on battery power until the battery pack is fully discharged. The battery light begins to blink when the battery pack has discharged to a low-battery condition. When the battery pack is fully discharged, the battery light is turned off and the computer shuts down.
Step 3: Recharging the battery pack

To recharge the battery pack:

1. Plug the computer into external power and maintain external power until the battery pack is fully recharged. When the battery pack is recharged, the battery light on the computer is turned off.

   You can use the computer while the battery pack is recharging, but the battery pack will charge more quickly if the computer is off.

2. If the computer is off, turn it on when the battery pack is fully charged and the battery light is turned off.

3. Access the Power Schemes tab by selecting **Start > Control Panel > Performance and Maintenance > Power Options > Power Schemes** tab.

4. Reenter the settings that you recorded for the items in the **Plugged In** column and the **Running on Batteries** column.

5. Click **OK**.

   **CAUTION** After calibrating the battery pack, reenable hibernation. Failure to reenable hibernation may result in a complete battery discharge and potential information loss.

   To reenable hibernation, select **Start > Control Panel > Performance and Maintenance > Power Options > Hibernate**. Select the **Enable hibernation** check box, and then click **Apply**.

Conserving battery power

Using the battery conservation procedures and settings described in this section extends the time that a battery pack can run the computer from a single charge.

Conserving power as you work

To conserve power as you use the computer:

- Turn off wireless and local area network (LAN) connections and exit modem applications when you are not using them.
- Disconnect external devices that you are not using that are not plugged into an external power source.
- Stop or remove any optional external media cards that you are not using.
- Remove a CD or DVD that you are not using.
- Use the **fn+f7** and **fn+f8** hotkeys to adjust screen brightness as you need it.
- Use optional powered speakers instead of the internal speakers, or adjust system volume as you need it.
- Turn off a device connected to the S-Video-out jack.
- If you leave your work, initiate standby or hibernation, or shut down the computer.
Selecting power conservation settings

To set the computer to conserve power:

- Select a short wait for the screen saver and select a screen saver with minimal graphics and motion.

To access screen saver settings:

Select Start > Control Panel > Appearance and Themes > Choose a screen saver.

- Select a Power Scheme with low power-use settings. For more information, refer to "Setting or changing a power scheme."

Storing a battery pack

⚠️ **WARNING!** To avoid potential safety issues, use only the battery pack provided with the computer, a replacement battery pack provided by HP, or a compatible battery pack purchased as an accessory from HP.

⚠️ **CAUTION** To prevent damage to a battery pack, do not expose it to high temperatures for extended periods of time.

If a computer will be unused and disconnected from external power for more than 2 weeks, remove the battery pack and store it separately.

To prolong the charge of a stored battery pack, place it in a cool, dry place.

Calibrate a battery pack before using it if it has been stored for one month or more.

Disposing of a used battery pack

⚠️ **WARNING!** To reduce the risk of fire or burns, do not disassemble, crush, or puncture a battery pack; short the external contacts on a battery pack; or dispose of a battery pack in fire or water. Do not expose a battery pack to temperatures above 60°C (140°F).

Refer to the *Regulatory, Safety, and Environmental Notices* for battery disposal information.
4 Drives

Drive care

Drives are fragile computer components that must be handled with care. The following cautions apply to all drives. Additional cautions are included with the procedures to which they apply.

CAUTION To reduce the risk of damage to the computer, damage to a drive, or loss information, observe these precautions:

Initiate standby before you move a computer or external hard drive from one location to another.

Before handling a drive, discharge static electricity by touching the unpainted metal surface of the drive.

Do not touch the connector pins on a removable drive or on the computer.

Handle a drive carefully; do not drop or compress the drive.

Before removing or inserting a drive, shut down the computer. If you are unsure whether the computer is off or in hibernation, turn the computer on, and then shut it down through the operating system.

Do not use excessive force when inserting a drive into a drive bay.

Do not type on the keyboard or move the computer when the drive is writing to a medium. The write process is sensitive to vibration.

When the battery pack is the only source of power, ensure that the battery pack is sufficiently charged before writing to a medium.

Avoid exposing a drive to temperature or humidity extremes.

Avoid exposing a drive to liquids. Do not spray it with cleaning products.

Remove the medium from a drive before removing the drive from the drive bay, or traveling with, shipping, or storing a drive.

If a drive must be mailed, place the drive in a bubble-pack mailer or other suitable protective packaging and label the package “FRAGILE.”

Avoid exposing a drive to magnetic fields. Security devices with magnetic fields include airport walk-through devices and security wands. The airport security devices that check carry-on luggage, such as conveyor belts, use x-rays instead of magnetism and will not damage a drive.
IDE drive light

The IDE drive light blinks when either the primary hard drive or an optical drive is being accessed.
Hard drive

CAUTION  To prevent system lockup and loss of information:

Shut down the computer before removing the hard drive from the hard drive bay. Do not
remove the hard drive while the computer is on, in standby, or in hibernation.

If you are not sure whether the computer is off or in hibernation, turn the computer on by
pressing the power button. Then shut down the computer through the operating system.

To remove the hard drive:

1. Save your work.
2. Shut down the computer and close the display.
3. Turn the computer upside down, with the hard drive bay toward you.
4. Loosen the 2 hard drive cover screws (1).
5. Lift the hard drive cover away from the computer (2).
6. Remove the two hard drive screws (1)
7. Disconnect the hard drive (2) by sliding it to the right.

8. Lift the hard drive away from the computer (3).

To install a hard drive:

1. Lower the hard drive into the hard drive bay (1).

2. Slide the hard drive toward the hard drive connector (2) until it is fully seated.
3. Replace the two hard drive screws (3).

4. Align the tabs (1) on the hard drive cover with the notches on the computer.

5. Close the cover (2).

6. Tighten the hard drive cover screws (3).
Optical drives

An optical drive, such as a DVD-ROM drive, supports optical discs (CDs and DVDs). These discs are used to store or transport data and to play music and movies. DVDs have a higher capacity than CDs.

The computer can read or write to optical drives as described in the following table.

Some of the optical drives listed may not be supported by your computer. The listed drives are not necessarily all of the supported optical drives.
Inserting an optical disc

1. Turn on the computer.

2. Press the release button (1) on the drive bezel to release the media tray.

3. Pull out the tray (2).

4. Hold the CD or DVD by the edges to avoid touching the flat surfaces, and position the disc over the tray spindle, with the label-side up.

   **NOTE** If the tray is not fully accessible, tilt the disc carefully to position it over the spindle.

5. Gently press the disc (3) down onto the tray spindle until the disc snaps into place.

6. Close the media tray.

   **NOTE** After you insert a disc, a short pause is normal. If you have not selected a default media player, an AutoPlay dialog box opens. It prompts you to select how you want to use the media content.
Removing an optical disc (with power)

If the computer is running on external or battery power:

1. Turn on the computer.

2. Press the release button (1) on the drive bezel to release the media tray, and then pull out the tray (2).

3. Remove the disc (3) from the tray by gently pressing down on the spindle while lifting the outer edges of the disc. Hold the disk by the edges and avoid touching the flat surfaces.

   NOTE  If the tray is not fully accessible, tilt the disc carefully as you remove it.

4. Close the media tray and place the disc in a protective case.
Removing an optical disc (without power)

If external or battery power is unavailable:

1. Insert the end of a paper clip (1) into the release access in the front bezel of the drive.

2. Press in gently until the tray is released, and then pull out the tray (2).

3. Remove the disc (3) from the tray by gently pressing down on the spindle while lifting the outer edges of the disc. Hold the disk by the edges and avoid touching the flat surfaces.

   **NOTE** If the tray is not fully accessible, tilt the disc carefully as you remove it.

4. Close the media tray and place the disc in a protective case.
Avoiding standby or hibernation

**CAUTION** To prevent possible audio and video degradation, or loss of audio or video playback functionality, do not initiate standby or hibernation while reading or writing to a CD or DVD.

To prevent loss of data, do not initiate standby or hibernation when writing to a CD or DVD.

If standby or hibernation is accidentally initiated during playback of a drive medium (such as a CD or DVD):

- Your playback may be interrupted.
- You may see the following warning: "Putting the computer into hibernation or standby may stop the playback. Do you want to continue?" Click **No**.
- You may need to restart the CD or DVD to resume audio and video playback.
5 Multimedia

Multimedia hardware

Using the optical drive

The optical drive allows you to play, copy, and create CDs or DVDs, depending on the type of installed drive and installed software.

2. Press in gently until the tray is released, and then pull out the tray (2).
3. Remove the disc (3) from the tray by gently pressing down on the spindle while lifting the outer edges of the disc. Hold the disk by the edges and avoid touching the flat surfaces.

**NOTE** If the tray is not fully accessible, tilt the disc carefully as you remove it.

4. Close the media tray and place the disc in a protective case.
Using media activity hotkeys

Media activity hotkeys are combinations of the fn key (1) and 4 of the function keys. You can use these keys to control the play of an audio CD or a DVD that is inserted in the optical drive.

NOTE To control the play of an inserted video CD, use the media activity controls in your video CD player application.

- To play, pause, or resume an inserted audio CD or a DVD, press fn+f9 (2).
- To stop an inserted audio CD or a DVD that is playing, press fn+f10 (3).
- To play the previous track of an audio CD or the previous chapter of a DVD that is playing, press fn+f11 (4).
- To play the next track of an audio CD or the next chapter of a DVD that is playing, press fn+f12 (5).
Using the QuickPlay buttons

NOTE DVD and Media button functions vary, depending on the software installed on your computer. Refer to the QuickPlay online Help for details.

The DVD button (1) and Media button (2) allow you to play DVDs, watch movies, and listen to music with the touch of a button.

NOTE On select models, this jack can also be used to transmit S/PDIF digital audio.
Using the audio-in (microphone) jack

The computer is equipped with a microphone jack that supports an optional monaural (single sound channel) microphone. Select models support a stereo (dual sound channel) microphone.

NOTE When connecting a microphone to the microphone jack, use a microphone with a 3.5-mm plug.

Using the audio-out (headphone) jack

WARNING! To reduce the risk of personal injury, adjust the volume before putting on headphones, earbuds, or a headset.

In addition to connecting headphones, the headphone jack is used to connect the audio function of an audio/video device such as a television or VCR. On select models, the computer can also transmit S/PDIF digital audio signals through the audio-out jack.

When connecting a device to the headphone jack use only a 3.5-mm stereo plug.

NOTE When a device is connected to the headphone jack, the internal speakers are disabled.

Using S/PDIF digital audio (select models only)

S/PDIF (Sony/Philips Digital Interface) or digital audio provides enhanced audio performance, including surround sound and other high-end audio output.

For digital audio connections, connect the S/PDIF digital audio plug to the digital audio connector on your audio/video equipment.

NOTE In order to use S/PDIF with your headphone jack, you will need an optional mini TOS link cable and/or adapter.

You can adjust the volume using the following controls:

● Computer volume buttons:
  ● To mute or restore volume, press the volume mute button.
  ● To decrease the volume, press the volume down button.

- External monitor port that connects a television, monitor, or projector to the computer

Using the external monitor port

The external monitor port connects an external display device to the computer.

To connect a display device to the computer, connect the device cable to the external monitor port.

NOTE If a properly connected external display device does not display an image, press fn + f4 to transfer the image to the device.
Using the S-Video-out jack

The 7-pin S-Video-out jack connects the computer to an optional S-Video device such as a television, VCR, camcorder, overhead projector, or video capture card.

The computer can support one S-Video device connected to the S-Video-out jack, while simultaneously supporting an image on the computer display or on any other supported external display.

NOTE To transmit video signals through the S-Video-out jack, you need an S-Video cable, available from most electronics retailers. If you are combining audio and video functions, such as playing a DVD movie on your computer and displaying it on your television, you also need a standard audio cable connected to the headphone jack, available from most electronics retailers.

NOTE The S-Video connection provides a higher quality image than a composite-video connection.

To connect a video device to the S-Video-out jack:

1. Plug one end of the S-Video cable into the S-Video-out jack on the computer.

2. Connect the other end of the cable to the video device, as instructed in the documentation included with the device.

3. Press the fn+f4 keys to switch the image between display devices connected to the computer.

| I cannot remove the remote control from the slot. | Depending on your remote control model, refer to the removal instructions in either "Storing the remote control in the PC Card slot" or "Storing the remote control in the ExpressCard slot." |
Multimedia software

The computer includes preinstalled multimedia software. Some models may be shipped with additional multimedia software on an optical disc.

Depending on the hardware and software included with the computer, the following multimedia tasks may be supported:

- Playing digital media, including audio and video CDs, audio and video DVDs, and Internet radio
- Creating or copying data CDs
- Creating, editing, and burning audio CDs
- Creating, editing, and burning a video or movie to a DVD or video CD

NOTE  For details about using software included with the computer, refer to the software user guides. These guides may be provided on CD or as online help files within the specific application. User guides may also be found on the software manufacturer’s Web site.

For details on using QuickPlay software, refer to the QuickPlay online Help.
Protecting playback

To prevent the loss of playback or playback quality:

- Save your work and close all open applications before playing a CD or a DVD.
- Do not connect or disconnect hardware while playing a disc.

To prevent the loss of playback while the computer is in Windows, do not initiate standby or hibernation while playing a disc. If standby or hibernation is initiated while a disc is in use, you may see the warning message “Putting the computer into Hibernation or Standby might stop the playback. Do you want to continue?” If this message is displayed, select No. After you select No:

- Playback may resume.
  – or –
- Playback may stop and the screen may clear. To return to playing the CD or DVD, press the power button and then restart the disc.

Protecting the CD or DVD write process

⚠️ CAUTION  To prevent loss of information and damage to a disc:

Before writing to a disc, close all open applications except the disc software you are using.

Do not copy directly from a source disc to a destination disc or from a network drive to a destination disc. Instead, copy from a source disc or network drive to your hard drive, and then copy from your hard drive to the destination disc.

Do not use the computer keyboard or move the computer while the computer is writing to a disc. The write process is sensitive to vibration.
Changing DVD region settings

Most DVDs that contain copyrighted files also contain region codes. The region codes help protect copyrights internationally.

You can play a DVD containing a region code only if the region code on the DVD matches the region setting on your DVD drive.

If the region code on a DVD does not match the region setting on your drive, the following message is displayed when you insert the DVD: “Playback of content from this region is not permitted.” To play the DVD, you must change the region setting on your DVD drive. DVD region settings can be changed through the operating system or through some DVD players.

⚠️ **CAUTION**   The region settings on your DVD drive can be changed only 5 times.

The region setting you select the fifth time becomes the permanent region setting on the DVD drive.

The number of allowable region changes remaining on the drive is displayed in the Changes remaining field on the **DVD Region** tab. The number in the field includes the fifth and permanent change.

To change settings through the operating system:

1. Select **Start > My Computer**.
2. Right-click in the window and select **Properties > Hardware tab > Device Manager**.

Like standard PC Cards, ExpressCards are designed to conform to the standard specifications of the Personal Computer Memory Card International Association (PCMCIA).

NOTE An ExpressCard can also add TV tuner functionality to the computer. For more information, refer to the manufacturer's user guide.

Selecting an ExpressCard

ExpressCards use one of 2 interfaces and are available in 2 sizes. The ExpressCard slot on the computer supports both interfaces and both sizes. For example, you can use

- An ExpressCard with either a USB interface or a PCI Express interface.
- A full-size ExpressCard, called ExpressCard/54 (1), or a smaller ExpressCard, called ExpressCard/34 (2).

The ExpressCard procedures described in the following sections are the same for both interfaces and both sizes.

Configure an ExpressCard

⚠️ CAUTION To prevent loss of support for other ExpressCards, install only the software required for the device. If you are instructed by the ExpressCard manufacturer to install device drivers:

Install only the device drivers for your operating system.

Do not install other software, such as card services, socket services, or enablers, supplied by the ExpressCard manufacturer.

   NOTE An inserted ExpressCard uses power even when idle. To conserve power, stop or remove an ExpressCard when it is not in use.
7 External Devices

Using a USB device

Universal Serial Bus (USB) is a hardware interface that can be used to connect an optional external device, such as a USB keyboard, mouse, drive, printer, scanner, or hub, to the computer or to an optional expansion product. A hub provides additional USB ports for the system and can be connected to the computer or to another hub.

The computer has 2 standard USB ports on the left side of the computer. A third USB port on the right side of the computer is available on select models only. An optional expansion product provides additional USB ports that can be used with the computer. The USB ports on the computer support USB 2.0 and USB 1.1 devices.

Connecting a USB device

To prevent damage to the USB connectors, use minimal force to connect a USB device.

To connect a USB device to the computer, connect the USB cable of the device to the USB port. The operating system will issue a sound to indicate that a device has been connected.

The first time you connect a USB device, the “Found New Hardware” message is displayed in the notification area, at the far right of the taskbar.
Stopping a USB device

CAUTION To prevent loss of information or an unresponsive system, stop the USB device before removing it.

To stop a USB device:

Required USB software

Some USB devices may require additional support software, which is usually included with the device. For more information about device-specific software, refer to the user guide for the device.
Using a 1394 device (select models only)

IEEE 1394 is a hardware interface that can be used to connect a high-speed multimedia or data storage device to the computer. Scanners, digital cameras, and digital camcorders often require a 1394 connection.

The 1394 port, illustrated below, supports IEEE 1394a devices.

Connecting a 1394 device

⚠️ **CAUTION** To prevent damage to the 1394 port connectors, use minimal force to connect a 1394 device.

To connect a 1394 device to the computer, connect the 1394 cable of the device to the 1394 port. The operating system will issue a sound to indicate that a device has been connected.

⚠️ **NOTE** The first time you connect a 1394 device, the "Found New Hardware" message is displayed at the bottom right of the screen in the notification area.

Stopping a 1394 device

⚠️ **CAUTION** To prevent loss of information or an unresponsive system, stop the 1394 device before removing it.

To stop a 1394 device:

1. Double-click the **Safely Remove Hardware** icon in the notification area, at the far right of the taskbar.

2. Click the 1394 device listing.

⚠️ **NOTE** To display the Safely Remove Hardware icon, click **Show Hidden Icons** in the notification area.

3. Click **Stop**.

Required 1394 software

You may have to load device-specific drivers and other software before using some 1394 devices. For more information about device-specific software, refer to the user guide for the device.
Using the expansion port

The expansion port on the left side of the computer allows you to connect the computer to an optional expansion product. An optional expansion product provides additional ports and connectors that can be used with the computer.
Adding or replacing memory modules

The computer has one memory module compartment, which is located on the bottom of the computer. The memory capacity of the computer can be upgraded by adding a memory module to the vacant expansion memory module slot or by upgrading the existing memory module in the primary memory module slot.

⚠️ **WARNING!** To reduce the risk of electric shock and damage to the equipment, unplug the power cord and remove all battery packs before installing a memory module.

⚠️ **CAUTION** Electrostatic discharge (ESD) can damage electronic components. Before beginning any procedure, ensure that you are discharged of static electricity by touching a grounded metal object.

To add or replace a memory module:

1. Shut down the computer. (If you are not sure whether the computer is off or in hibernation, turn the computer on by pressing the power button. Then shut down the computer through the operating system.)
2. Disconnect all external devices connected to the computer.
3. Disconnect the power cord.
4. Turn the computer upside down.
5. Remove the battery pack from the computer.
6. Loosen the 2 memory module compartment cover screws (1).
7. Lift the memory module compartment cover (2) away from the computer.

8. To remove a memory module:
   a. Pull away the retention clips (1) on each side of the memory module. (The memory module tilts up.)
   b. Grasp the edge of the memory module (2) and gently pull the module out of the memory module slot. (To protect a memory module after removal, place it in an electrostatic-safe container.)
9. To insert a memory module:
   a. Align the notched edge (1) of the memory module with the tab in the memory module slot.
   b. With the memory module at a 45-degree angle from the surface of the memory module compartment, press the module (2) into the memory module slot until it is seated.
   c. Press the memory module (3) down until the retention clips snap into place.

10. Align the tabs (1) on the memory module compartment cover with the notches on the computer.

11. Close the cover (2).
12. Tighten the memory module compartment cover screws (3).

13. Replace the battery pack.

14. Reconnect external power and external devices.

15. Turn on the computer.
Effects of increasing memory

When random access memory (RAM) increases, the operating system increases the hard drive space reserved for the hibernation file.

If you experience problems with hibernation after increasing memory, verify that the hard drive has enough free space to accommodate a larger hibernation file.

To display the amount of space required by the hibernation file:

▲ Select Start > Control Panel > Performance and Maintenance > Power Options > Hibernate tab.

To display the amount of memory in the system:

● Select Start > Control Panel > Performance and Maintenance > System > General tab.

– or –

● Press fn+esc.

To display the amount of free space on the hard drive:

1. Select Start > My Computer.
2. Right click the primary hard drive listing, and then click Properties.
Video memory settings (select models only)

NOTE  Video memory capacity and settings vary by model. Video memory settings can be changed on select models only and should only be changed by advanced users.

1. If you are not sure whether the computer is off or in hibernation, press the power button.
   The computer starts up or is restored from hibernation.

2. Display the setup message:
   • If the computer is on, restart it through the operating system.
   • If the computer is off, turn it on.

3. Press F10 while the “Press <F10> to enter Setup” message is displayed in the lower-left corner of the screen.

4. Use the arrow keys to select the System Configuration menu.
   Memory information and settings are displayed.

5. To change the shared video memory setting, use the navigation and selection information at the bottom of the screen to choose your Video Memory preference.

6. To set your preference and exit the Setup Utility, press F10 and then follow the instructions on the screen.
   Your preferences go into effect when the computer restarts.
9 Wireless (Select Models Only)

Wireless features

A wireless computer includes 802.11 or Bluetooth® wireless capability or both.

These devices differ in the following ways:

- An 802.11 wireless computer can connect to wireless local area networks (WLANs) in corporate offices, your home, and public places such as airports, restaurants, coffee shops, hotels, and universities. Hotspots are public places where you can access a wireless network. Contact your Internet service provider (ISP) or search the Web for a list of hotspots near you.

- A Bluetooth wireless computer can connect to other Bluetooth wireless-enabled devices such as computers, phones, printers, headsets, speakers, and cameras.

NOTE The computer may look different from the illustrations in this guide. The location and number of buttons, lights, and jacks vary by model.

Identifying an 802.11 wireless device

You may need to know the name of the integrated 802.11 wireless device installed in the computer. To identify an 802.11 wireless device:

1. Display the names of the network devices on the computer:
   a. Select Start > My Computer.
   b. Right-click in the My Computer window.
   c. Select Properties > Hardware tab > Device Manager > Network Adapters.

2. Identify the 802.11 wireless device from the list that is displayed:
   - The listing for an 802.11 wireless device includes the term wireless, wireless LAN, WLAN, or 802.11.
   - If no 802.11 wireless device is listed, either the computer does not have an integrated 802.11 wireless device, or the driver for the 802.11 wireless device is not properly installed.
Wireless controls

The wireless button enables and disables 802.11 and Bluetooth wireless devices, and the wireless light indicates the state of the wireless devices.

The following illustration shows the wireless button (1) and associated wireless light (2). The wireless light is on by default.

NOTE The location of the wireless button and light varies by model.

You can enable and disable the wireless devices with the wireless button. You can also enable and disable the wireless devices in the Setup Utility.

Select models also include the Wireless Assistant utility. With the Wireless Assistant, you can turn on or off the 802.11 or Bluetooth devices individually. For more information, refer to the Wireless Assistant online Help.
A computer with an 802.11 wireless device can access a wireless local area network (commonly referred to as wireless network, wireless LAN, or WLAN), which is composed of other computers and accessories linked by a wireless router or a wireless access point:

- A home or small office WLAN typically uses a wireless router, which enables several wireless and wired computers to share an Internet connection, a printer, and files without additional pieces of hardware or software.

  **NOTE** The terms *wireless access point* and *wireless router* are often used interchangeably.

- A large-scale WLAN, such as a corporate or public WLAN, typically uses wireless access points that can handle a large number of computers and accessories and can separate critical network functions.

802.11 wireless devices include:

- 802.11b
- 802.11b/g
- 802.11a/b/g

Computers with 802.11 wireless devices may support 1 or more of 3 industry standards:

- 802.11b supports data rates of up to 11 Mbps and operates at a frequency of 2.4 GHz.
- 802.11g supports data rates of up to 54 Mbps and operates at a frequency of 2.4 GHz. An 802.11g WLAN device is backward compatible with 802.11b devices, so they can operate on the same network.
- 802.11a supports data rates of up to 54 Mbps and operates at a frequency of 5 GHz. 802.11a is not compatible with 802.11b and 802.11g.

For information on identifying the wireless device in the computer, refer to “Identifying an 802.11 wireless device.”
Setting up a WLAN in your home

Microsoft® Windows® XP supports WLAN with the Wireless Network Connection feature.

To set up a WLAN and connect to the Internet in your home, you need the following equipment:

- A broadband modem (either DSL or cable) (1) and high-speed Internet service purchased from an Internet service provider (ISP).
- A wireless router (purchased separately) (2).
- The wireless computer (3).

The illustration below shows an example of a wireless network installation that is connected to the Internet.

As your network grows, additional wireless and wired computers can be connected to the network to access the Internet.

**NOTE** If you need technical assistance to install your home WLAN, contact the router manufacturer or your ISP.
Connecting to a WLAN in your home

To connect to your WLAN:

1. Be sure that the 802.11 wireless device is on. If it is on, the wireless light is on. If the wireless light is off, turn on the wireless device.

2. Be sure that your router is correctly installed and configured. For instructions, refer to your router user guide.

3. Use the Wireless Network Connection feature of Microsoft Windows XP to connect the computer to the WLAN.

**NOTE** Functional range for subsequent WLAN connections will vary, depending on the computer WLAN implementation, router manufacturer, and interference from walls and other electronic devices.

For more information about connecting to a WLAN in your home:

- Refer to information from your ISP and the user guide included with your wireless router and other WLAN equipment.

- Access the information and Web site links provided in the Help and Support Center.

Connecting to a public WLAN

Contact your ISP or search the Web for a list of public WLANs near you. Web sites that list public WLANs include Cisco Hotspot Locator, Hotspotlist, and Geektools.

When you are within range of a public WLAN, a Wireless Network Connection interactive message is displayed at the bottom of the computer screen. Check with each public WLAN location for cost and connection requirements.

Using wireless security features

When you set up your home WLAN or access an existing public WLAN, be sure that security features are protecting the WLAN. If you do not enable security on your WLAN, an unauthorized wireless user can access your information and use your Internet connection without your knowledge.

The most common security levels are Wi-Fi Protected Access (WPA)-Personal and Wired Equivalent Privacy (WEP). In addition to enabling WPA-Personal or WEP security encryption on the router, you may want to use one or more of the following security measures:

- Change the default network name (SSID) and password.

- Use a firewall.

- Set security on your Web browser.

- Enable MAC address filtering on the router.
Bluetooth wireless devices (select models only)

A Bluetooth wireless device provides short-range wireless communications that replace the physical cable connections that traditionally link electronic devices such as

- Network access points.
- Computers (desktop, notebook, PDA).
- Phones (cellular, cordless, smart phone).
- Imaging devices (printer, camera).
- Audio devices (headset, speakers).

The devices are represented in the Bluetooth for Windows software by graphical icons.

The Bluetooth for Windows software provides the following functions:

- Personal Information Management (PIM) item transfer—Enables the exchange of information files such as business cards, calendar items, notes, and message items between Bluetooth computers or devices.
- PIM synchronization—Synchronizes PIM data between a Bluetooth wireless device and a computer, PDA, or cell phone using Bluetooth.
- File Transfer—Enables the exchange of files between Bluetooth computers or devices.
- Network access (Personal Area Networking Profile)—Enables 2 or more Bluetooth devices to form an ad hoc (peer-to-peer) network. Provides a mechanism that enables a Bluetooth device to access a remote network through a network access point. The network access points can be traditional LAN data access points or group ad hoc networks that represent a set of devices that are attached only to one another.
- Dial-up networking—Connects Bluetooth devices to the Internet.
- Bluetooth serial port—Transfers data over the Bluetooth link using a virtual COM port.
- Hands-Free—Enables a vehicle-embedded, hands-free unit or a computer serving as a hands-free unit to establish a wireless connection to a cellular phone and to act as the Bluetooth cellular phone audio input and output mechanism.
- Basic imaging—Provides a wireless connection between a Bluetooth-enabled camera and other Bluetooth devices. The camera can be controlled remotely by a computer, and images can be transferred from a camera to be stored on a computer or to be printed.
- Human interface device—Provides a wireless connection to other Bluetooth devices, such as keyboards, pointing devices, gaming devices, and remote monitoring devices.
- Fax—Provides a Bluetooth connection that enables a computer to send or receive a fax message using a Bluetooth cellular phone or modem.
- Headset—Provides a wireless connection between a headset and a computer or cellular phone. The headset acts as the device’s audio input and output mechanism and increases mobility.
Modem

The modem in the computer must be connected to an analog telephone line using a 6-pin, RJ-11 modem cable. In some countries, a country-specific modem cable adapter is also required. Jacks for digital PBX systems may resemble analog telephone jacks, but they are not compatible with the modem.

⚠️ WARNING! Connecting the internal analog modem to a digital line can permanently damage the modem. Immediately disconnect the modem cable if you accidentally connect it to a digital line.

If the modem cable contains noise suppression circuitry (1), which prevents interference from TV and radio reception, orient the circuitry end (2) of the cable toward the computer.

不同程度的改变可能会影响写作内容。
Connecting the modem cable

**WARNING!** To reduce the risk of electric shock, fire, or damage to the equipment, do not plug a modem or telephone cable into the RJ-45 (network) jack.

To connect a modem cable:

1. Plug the modem cable into the modem jack (1) on the computer.
2. Plug the modem cable into the RJ-11 telephone wall jack (2).
Connecting a country-specific modem cable adapter

Telephone jacks vary by country. To use the modem and the modem cable outside the country in which you purchased the computer, you must obtain a country-specific modem cable adapter.

To connect the modem to an analog telephone line that does not have an RJ-11 telephone jack:

1. Plug the modem cable into the modem jack (1) on the computer.
2. Plug the modem cable into the country-specific modem cable adapter (2).
3. Plug the country-specific modem cable adapter (3) into the telephone wall jack.

Selecting a location setting

Viewing the current country selection

To view the current country setting for the modem:

1. Select Start > Control Panel.
2. Click Date, Time, Language, and Regional Options.
3. Click Regional & Language Options.
4. Under Location, view your present location.
Adding new locations when traveling

By default, the only location setting available to the modem is a location setting for the country in which you purchased the computer. As you travel to different countries, set the internal modem to a location setting that meets the operating standards of the country in which you are using the modem.

As you add new location settings, they are saved by the computer so that you can switch among settings at any time. You can add multiple location settings for any country.

⚠️ **CAUTION** To prevent losing your home country settings, do not delete your current modem country settings. To enable modem use in other countries while preserving your home country configuration, add a new configuration for each location in which you will use the modem.

⚠️ **CAUTION** To prevent configuring the modem in a way that violates the telecommunications regulations and laws of the country you are visiting, select the country in which the computer is located. The modem may not function properly if the correct country selection is not made.

To add a location setting for the modem:

1. Select **Start > Control Panel > Network and Internet Connections**.
2. On the upper menu in the left pane of the Network and Internet Connections window, click **Phone and Modem Options**.
3. On the **Dialing Rules** tab, click **New**. (The New Location window is displayed.)
4. In the **Location name** box, type a name (home, work, etc.) for the new location setting.
5. Click a country or region from the **Country/Region** drop-down list. (If you select a country or region that is not supported by the modem, the Country/Region selection for **USA** or **UK** is displayed by default.)
6. Click **OK** to save your new location setting. (The Dialing Rules window is displayed.) Then
   - To set your new location setting as the current location, click **OK**.
   - To select another location setting as the current location setting, click your preference from the settings in the **Location** list, and then click **OK**.

*NOTE* You can use the preceding procedure to add location settings for places within your own country as well as in other countries. For example, you could add a setting named “Work” that includes dialing rules for accessing an outside line.
Solving travel connection problems

If you experience modem connection problems when using the computer outside of the country in which you purchased it, try the following suggestions.

- **Check the telephone line type.**
  
The modem requires an analog, not a digital, telephone line. A line described as a PBX line is usually a digital line. A telephone line described as a data line, fax machine line, modem line, or standard telephone line is usually an analog line.

- **Check for pulse or tone dialing.**
  
  An analog telephone line supports one of 2 dialing modes: pulse dialing or tone dialing. These dialing mode options are selected in the Phone and Modem Options settings. The dialing mode option selected must match the dialing mode supported by the telephone line in your location.

  To determine the dialing mode supported by a telephone line, dial a few digits on the telephone, and then listen for clicks (pulses) or tones. Clicks indicate that the telephone line supports pulse dialing. Tones indicate that the telephone line supports tone dialing.

  To change the dialing mode in your current modem location setting:
  
  a. Select **Start > Control Panel > Network and Internet Connections**.
  
  b. On the upper menu in the left pane of the Network and Internet Connections window, click **Phone and Modem Options**.
  
  c. Click the **Dialing Rules** tab.
  
  d. Select your modem location setting.
  
  e. Click **Edit**.
  
  f. Click either **Tone** or **Pulse**.
  
  g. Click **OK** twice.

- **Check the telephone number you are dialing and the response of the remote modem.**
  
  Dial a telephone number, make sure there is a response from the remote modem, and then hang up.

- **Set the modem to ignore dial tones.**
  
  If the modem receives a dial tone it does not recognize, it does not dial and displays a “No Dial Tone” error message.

  To set the modem to ignore all dial tones before dialing:
  
  a. Select **Start > Control Panel > Network and Internet Connections**.
  
  b. On the upper menu in the left pane of the Network and Internet Connections window, click **Phone and Modem Options**.
  
  c. Click the **Modems** tab.
  
  d. Click the listing for the modem.
  
  e. Click **Properties**.
f. Click Modem.

g. Clear the check box for *Wait for dial tone before dialing*.

h. Click OK twice.

If you continue to receive the “No Dial Tone” error message after clearing the *Wait for dial tone before dialing* check box:

1. Select **Start > Control Panel > Network and Internet Connections**.

2. On the upper menu in the left pane of the Network and Internet Connections window, click **Phone and Modem Options**.

3. Click the **Dialing Rules** tab.

4. Select your current modem location setting.

5. Click **Edit**.

6. Select your current location from the **Country/Region** drop-down list. If you select a country or region that is not supported by the modem, the Country/Region selection for **USA** or **UK** is displayed by default.

7. Click **Apply** and then **OK**.

8. In the Phone and Modem Options window, click the **Modems** tab.

9. Click the listing for the modem, and then click **Properties**.

10. Clear the check box for **Wait for dial tone before dialing**.

11. Click **OK** twice.

### Using preinstalled communication software

To use preinstalled modem software for terminal emulation and data transfer:

1. Select **Start > All Programs > Accessories > Communications**.

2. Click a fax or terminal emulation program or Internet connection wizard.
Local area networks

Connecting to a local area network (LAN) requires an 8-pin, RJ-45 network cable (not included). If the network cable contains noise suppression circuitry (1), which prevents interference from TV and radio reception, orient the circuitry end of the cable (2) toward the computer.

**NOTE** The computer may look different from the illustrations in this guide. The location of the network jack varies by model.

To connect the network cable:

1. Plug the network cable into the network jack (1) on the computer.
2. Plug the other end of the cable into a network wall jack (2).

WARNING! To reduce the risk of electric shock, fire, or damage to the equipment, do not plug a modem or telephone cable into the RJ-45 (network) jack.
11 Security

Security features

Standard security features provided by the Microsoft® Windows® operating system and the non-Windows Setup Utility can protect your personal settings and information from a variety of risks.

Follow the procedures in this chapter for using

- Passwords
- Antivirus software
- Firewall software
- Critical security updates

Passwords

A password is a group of characters that you choose to secure the computer information. Several types of passwords can be set, depending on how you want to control access to your information. Passwords can be set in Windows or in the non-Windows Setup Utility preinstalled on the computer.

CAUTION To prevent being locked out of the computer, record each password you set. Because most passwords are not displayed as they are set, changed, or deleted, it is essential to record each password immediately and store it in a secure place.

Guidelines for setting passwords

You can use the same password for a Setup Utility feature and for a Windows security feature. You can also use the same password for more than one Setup Utility feature.

A password set in the Setup Utility

- Can be any combination of up to 8 letters and numbers and is not case sensitive.
- Must be set and entered with the same keys. For example, if you set a password with keyboard number keys, your password will not be recognized if you subsequently try to enter it with the embedded numeric keypad.

NOTE Select models include a separate numeric keypad, which functions exactly like the keyboard number keys.

- Must be entered at a Setup Utility prompt. A password set in Windows must be entered at a Windows prompt.

Tips for creating and saving passwords:

- When creating passwords, follow requirements set by the program.
- Write down your passwords and store them in a secure place away from the computer.
- Do not store passwords in a file on the computer.
- Do not use your name or other personal information that could be easily discovered by an outsider.

The following tables list Windows and Setup Utility passwords and describe their functions.

*For details about each of these passwords, refer to the following sections.

Administrator password

The administrator password protects the configuration settings and system identification information in the Setup Utility. After this password is set, you must enter it each time you access the Setup Utility.

The administrator password

● Is not interchangeable with an administrator password set in Windows.

● Is not displayed as it is set, entered, changed, or deleted. Make sure you record your password and store it in a secure place.

Managing an administrator password

To set, change, or delete this password:

1. Open the Setup Utility by turning on or restarting the computer, and then pressing f10 while the setup message is displayed in the lower-left corner of the screen.

2. Use the arrow keys to select Security > Administrator Password, and then press enter.

   ● To set an administrator password, type your password in the Enter New Password and Confirm New Password fields, and then press enter.

3. To save your preferences and exit the Setup Utility, press f10, and then follow the instructions on the screen.

Your preferences go into effect when the computer restarts.
Entering an administrator password

After an administrator password has been set, you will be prompted to enter your password each time you access the Setup Utility.

At the **Enter Password** prompt, type in the administrator password (using the same keys you used to set your password), and then press enter. After 3 unsuccessful attempts to enter the administrator password, you must restart the computer and try again.

Power-on password

The power-on password prevents unauthorized use of the computer. After this password is set, it must be entered each time you turn on the computer or restart or restore from hibernation. A power-on password is not displayed as it is set, entered, changed, or deleted.

Managing a power-on password

To set, change, or delete this password:

1. Open the Setup Utility by turning on or restarting the computer, and then pressing f10 while the setup message is displayed in the lower-left corner of the screen.

2. Use the arrow keys to select **Security > Power-On password**, and then press enter.

   - To set a power-on password, type your password in the **Enter New Password** and **Confirm New Password** fields, and then press enter.

   - To change a power-on password, type your current password in the **Enter Current Password** field, type a new password in the **Enter New Password** and **Confirm New Password** fields, and then press enter.

3. To save your preferences and exit the Setup Utility, press f10, and then follow the instructions on the screen.

   Your preferences go into effect when the computer restarts.

Entering a power-on password

At the **Enter Password** prompt, type your password (using the same keys you used to set your password), and then press enter. After 3 unsuccessful attempts to enter your password, you must restart the computer and try again.
Antivirus software

When you use the computer for e-mail, network, or Internet access, you expose it to computer viruses that can disable the operating system, applications, or utilities, or cause them to function abnormally.

Antivirus software can detect most viruses, destroy them, and in most cases, repair any damage they have caused. To provide ongoing protection against newly discovered viruses, antivirus software must be kept up to date.

Norton Internet Security software is preinstalled on the computer. The software includes 60 days of free updates. It is strongly recommended that you protect the computer against new viruses beyond 60 days by purchasing extended update service. Instructions for using and updating Norton Internet Security software and for purchasing extended update service are provided within the application. To view and access Norton Internet Security, select Start > All Programs.

Firewall software

When you use the computer for e-mail, network, or Internet access, unauthorized persons may be able to gain access to information about you, the computer, and your information. Use the firewall software preinstalled on the computer to protect your privacy.

Firewall features include logging, reporting, and automatic alarms to monitor all incoming and outgoing traffic. Refer to the firewall user guide or contact your firewall manufacturer for more information.

**NOTE** Under some circumstances, a firewall can block access to Internet games, interfere with printer or file sharing on a network, or block authorized e-mail attachments. To temporarily solve the problem, disable the firewall, perform the task that you want to perform, and then reenable the firewall. To permanently resolve the problem, reconfigure the firewall.

Critical updates

**CAUTION** To protect the computer from security breaches and computer viruses, install the online critical updates from Microsoft as soon as you receive an alert.

Additional updates to the operating system and other software may have become available after the computer was shipped. To be sure that all available updates are installed on the computer:

- Run Windows Update monthly to install the latest software from Microsoft.
- Obtain updates, as they are released, from the Microsoft Web site and through the updates link in the Help and Support Center.
Optional security cable

NOTE The security cable is designed to act as a deterrent, but may not prevent the computer from being mishandled or stolen.

To install a security cable:

1. Loop the security cable around a secured object.
2. Insert the key (1) into the cable lock (2).
3. Insert the cable lock into the security cable slot on the computer (3), and then lock the cable lock with the key.

NOTE The location of the security cable slot varies by model.
Setup Utility access

The Setup Utility allows you to view system information, manage computer settings, and change system defaults.

The Setup Utility is a preinstalled, ROM-based utility that can be used even when the operating system is not working properly. If the operating system is working, the computer restarts the operating system after you exit the Setup Utility.

NOTE To navigate in the Setup Utility:
You must use the keyboard arrow keys to navigate and make selections. Pointing devices are not supported in the Setup Utility.
An external keyboard connected to a USB port can be used to navigate the Setup Utility.

13 Software Update and Recovery

Software updates

Updated versions of the software provided with the computer may be available through the HP Software Update utility or on the HP Web site.

⚠️ CAUTION ⚠️ If the computer is connected to a network, it is recommended that you consult with your network administrator before installing any software updates, especially system BIOS updates.

HP Software Update

HP Software Update is a utility included on the computer that automatically checks for software updates from HP. It automatically runs every 30 days and provides a list of software updates and support alerts for the computer.

To run HP Software Update:

▲ Select **Start > All Programs > HP > HP Software Update**.
Software updates and the HP Web site

Most software on the HP Web site is packaged in compressed files called *SoftPaqs*.

Some download packages contain a file named Readme.txt, which contains information regarding installing and troubleshooting the file. Readme.txt files included with the SoftPaqs are provided in English only.

Accessing computer information

Before you access updates from the HP Web site, collect the following information:

- The product category is computer.
- The product family name, series number, and serial number (S/N) are provided on the service tag.

To determine whether available BIOS updates contain later BIOS versions than those currently installed on the computer, you need to know the version of the system BIOS currently installed.

*NOTE* The BIOS initializes the operating system, determines how the computer will interact with the hardware devices, and provides for information transfer among hardware devices, including the time and date. The computer system BIOS is stored on the system ROM.

BIOS version information (also known as ROM date and System BIOS) can be displayed by pressing *fn+esc* (if you are already in Windows) or by opening the Setup Utility.

To use the Setup Utility for displaying BIOS information:

1. Open the Setup Utility by turning on or restarting the computer, and then pressing *f10* while the “Press <F10> to enter Setup” message is displayed in the lower-left corner of the screen.

2. If the Setup Utility does not open with the system information displayed, use the arrow keys to select the **Main** menu.

   When the Main menu is selected, BIOS and other system information is displayed.

3. To exit the Setup Utility, use the arrow keys to select **Exit > Exit Discarding Changes**, and then press *enter*.
CAUTION  To prevent damage to the computer or an unsuccessful installation, download and install a BIOS update only when the computer is connected to reliable external power using the AC adapter. Do not download or install a BIOS update while the computer is running on battery power, connected to an optional expansion product, or connected to an optional power source. During the download and installation:

- Do not disconnect power from the computer by unplugging the power cord from the AC outlet.
- Do not shut down the computer or initiate standby or hibernation.
- Do not insert, remove, connect, or disconnect any device, cable, or cord.

To download a BIOS update:

1. Visit the HP Web site at [http://www.hp.com](http://www.hp.com) and click the software and drivers download link.

2. Follow the instructions on the screen to identify the computer and access the BIOS update you want to download.

3. At the download area:

   a. Identify the newest BIOS update that is later than the BIOS version currently installed on the computer. Make a note of the date, name, or other identifier. You may need this information to locate the update later, after it has been downloaded to your hard drive.

   b. Follow the instructions on the screen to download your selection to the hard drive.

   **NOTE**  Make a note of the path to the location on your hard drive where the BIOS update will be downloaded. You will need to access this path when you are ready to install the update.
Installing a BIOS update

NOTE If you connect the computer to a network, consult the network administrator before installing any software updates, especially system BIOS updates.

BIOS installation procedures vary. Follow any instructions that are displayed on the screen after the download is complete. If no instructions are displayed:

1. Open Microsoft® Windows® Explorer by selecting Start > All Programs > Accessories > Windows Explorer.

2. In the left pane of the Windows Explorer window:
   a. Click My Computer and then your hard drive designation. (The hard drive designation is typically Local Disk C.)
   b. Using the hard drive path you recorded earlier, open the folder on your hard drive that contains the update.

3. Double-click the file that has an .exe extension (for example, filename.exe).

   The BIOS installation begins.

4. Complete the installation by following the instructions on the screen.

NOTE After a message on the screen reports a successful installation, you may delete the downloaded file from your hard drive.
**Downloading and installing other software**

To download and install software other than a BIOS update:

1. Visit the HP Web site at [http://www.hp.com](http://www.hp.com) and click the software and drivers download link.

2. Follow the instructions on the screen to find the software you want to update.

3. At the download area, select the software you want and follow the download instructions on the Web page.

   **NOTE** Make a note of the path to the location on your hard drive where the software will be downloaded. You will need to access this path when you are ready to install the software.

4. When the download is complete, open Windows Explorer by selecting **Start > All Programs > Accessories > Windows Explorer**.

5. In the left pane of the Windows Explorer window:
   
   a. Click **My Computer** and then your hard drive designation. (The hard drive designation is typically Local Disk C.)

   b. Using the hard drive path you recorded earlier, open the folder on your hard drive that contains the software.

6. Double-click the file that has an .exe extension (for example, *filename.exe*).
   
   The installation begins.

7. Complete the installation by following the instructions on the screen.

   **NOTE** After a message on the screen reports a successful installation, you may delete the download package from your hard drive.
System recovery

The computer system recovery process provides several ways to recover optimal system functionality. For best results, attempt to recover optimal computer functionality by using the following procedures in the order described here.

Safeguarding your information

Software or devices added to the computer can cause your system to become unstable. To safeguard your documents, store personal files in the My Documents folder and periodically create a backup copy of the My Documents folder.

Using System Restore

System Restore is an operating system feature that allows you to reverse undesirable changes to the computer by restoring the computer to an earlier state, called a restore point. A restore point is a “snapshot” of your software, drivers, and operating system files at a particular time. The computer automatically creates restore points at regular intervals and may create additional restore points when you change your personal settings or add software or hardware.

You can manually create additional restore points to provide increased protection for your system files and settings. It is recommended that you manually create restore points

● Before you add or extensively modify software or hardware.

● Periodically, whenever the system is performing optimally.

Restoring to any restore point does not affect your information files. For example, restoring your system software to an earlier state will not affect documents or e-mails that you saved after that time.

NOTE  If you do not like the results of your restoration, you can reverse the restoration.

Creating a restore point

To create a restore point:

1. Click System Restore in the Help and Support Center.
   The System Restore window opens.

2. Click Create a restore point, and then click Next.

3. Follow the on-screen instructions.
Restoring to a restore point

To restore the computer to a previous date and time when it was functioning optimally:

1. Click **System Restore** in the Help and Support Center.
   
   The System Restore window opens.

2. Click **Restore my computer to an earlier time**, and then click **Next**.

3. Follow the on-screen instructions.

Reinstalling applications

Applications preinstalled or preloaded on the computer can be reinstalled by using the *Recovery* disc or a third-party software disc.

![NOTE] In most cases, the applications preloaded on the computer, such as those available in the Software Setup utility, can be reinstalled from your hard drive. To access the Software Setup utility, select **Start > All Programs > Software Setup**.

The application reinstallation process replaces corrupted system files within the application and reinstalls deleted system files within the application.

- In most cases: If the application you are reinstalling is still installed on the computer, the reinstallation process does not affect your settings within the application.

- In all cases: If an application has been deleted from the computer, the reinstallation process reinstalls the application or utility to the factory image but cannot restore your personal settings.

Reinstalling applications from the hard drive

To reinstall a preloaded application or utility from your hard drive:

1. Select **Start > All Programs > Software Setup**, and then follow the instructions on the screen.

2. When you are prompted to select the software you want to reinstall, select or clear the appropriate check boxes.

Reinstalling applications from discs

To reinstall applications from a disc:

1. Insert the disc into the optical drive.
   
   - If Autorun is enabled, an installation wizard opens.
   
   - If Autorun is disabled, select **Start > Run**. Enter
     
     \[x:\text{setup.exe}\]
     
     where \(x\) is your optical drive designation
     
     and then click **OK**.

2. When the installation wizard opens, follow the installation instructions on the screen.

3. Restart the computer if prompted.
Repairing the operating system

To attempt an operating system repair without deleting your personal information, use the Operating System disc that was shipped with the computer:

- **NOTE** When repairing the operating system, be sure to use the disc that contains the language that was preinstalled on the computer.

- **NOTE** If the computer does not have an optical drive, you may need to connect it to an optional external optical drive.

1. Plug the computer into external power through the AC adapter and turn on the computer.
2. Immediately insert the Operating System disc into the computer.
3. Press and hold the power button for at least 5 seconds to turn off the computer.
4. Press the power button again to turn on the computer.
5. When prompted, press any key to start from the disc.
   After a few minutes, you may need to select your language to enable the Setup Wizard to open.
   - **NOTE** On the “Welcome to Setup” page, do not press R (step 8 in this procedure) until you have completed steps 6 and 7.
6. Press *enter* to continue.
   A licensing agreement page is displayed.
7. Press *f8* to accept the agreement and continue.
   The "Setup" page is displayed.
8. Press *R* to repair the selected Windows installation.
   The repair process begins. This process may take up to 2 hours to complete.
   The computer restarts in Windows after the process is complete.
Reinstalling the operating system

If you could not solve the problem by repairing the operating system as described in the previous section, it may be necessary to reinstall the operating system.

⚠️ **CAUTION** To prevent the loss of all of your personal information, back up your files before reinstalling the operating system. Reinstalling the operating system deletes all personal information, settings, and software on the computer.

After you complete the reinstallation:

- You must reinstall all drivers required for computer functionality.
- To fully restore your system, you will also need to
  - Reinstall all of your additional software.
  - Update all of your reinstalled software, including the operating system.

💡 **NOTE** When reinstalling the operating system, be sure to use the disc that contains the language that was preinstalled on the computer.

Back up your system

You can choose any of the following solutions to back up your system:

- Purchase optional system backup software.
- Copy personal information to storage devices other than the hard drive.
- Use the system backup utility available in Windows XP Professional.

If you plan to select the items you want to back up, rather than backing up your entire system, the following suggestions may be helpful:

- On many computers, files are stored by default in the My Documents folder. If you created information files in other locations, be sure to check all the possible locations.
- Templates are often stored in the folders of their associated applications.
- If you have customized the settings in a window, toolbar, or menu bar, you may want to take a screen shot of that element. The screen shot could be a time-saving reference when you begin resetting your preferences. A screen shot is a copy of an element on the screen. To copy the element from the screen and paste it into a Word document:
  a. Display the element on the screen.
  b. Copy the element or the entire screen:
     - To copy only the active window, press `alt+fn+prt sc`.
     - To copy the entire screen, press `fn+prt sc`.
  c. To paste the copied images into a document, open Word, and then select **Edit > Paste**.
Reinstall the operating system

NOTE During the reinstallation, you may be prompted for the Product Key. The Product Key is provided on the Microsoft Certificate of Authenticity label on the bottom of the computer.

NOTE During the reinstallation, it is normal for some computer models to pause occasionally for several minutes and to restart several times. These normal pauses are indicated by an hourglass icon.

To reinstall the operating system using the Operating System disc included with the computer:

NOTE If the computer does not have an optical drive, you may need to connect it to an optional external optical drive.

1. Plug the computer into external power through the AC adapter, and turn on the computer.
2. Immediately insert the Operating System disc into the computer.
3. Press and hold the power button for at least 5 seconds to turn off the computer.
4. Press the power button again to turn on the computer.
5. When prompted, press any key to start from the disc.
   After a few minutes, you may need to select your language to enable the Setup Wizard to open.
6. Press enter to continue.
   A licensing agreement page is displayed.
7. Press f8 to accept the agreement and continue.
   The "Setup" page is displayed.
8. Press esc to continue installing a new copy of the operating system instead of repairing it.
9. Press enter to set up the operating system.
10. Press C to continue setup using this partition.
11. Select Format the partition using the NTFS file system (Quick), and then press enter.

   CAUTION Formatting this drive deletes all current files.

12. Press F to format the drive.
    The reinstallation process begins. This process may take up to 2 hours to complete.
    The computer restarts in Windows when the process is complete.
Reinstalling device drivers and other software

After the operating system installation process is complete, you must reinstall drivers.

To reinstall drivers, use the *Recovery* disc included with the computer:

1. While running Windows, insert the *Recovery* disc into the optical drive.
2. If Autorun is not enabled:
   a. Select **Start > Run**.
   b. Then type `D:\SWSETUP\APPINSTL\SETUP.EXE`
      where *D* indicates the optical drive.
3. Follow the on-screen instructions for installing the drivers.

After the drivers are reinstalled, you must reinstall any software you added to the computer. Follow the installation instructions provided with the software.

Update reinstalled software

It is strongly recommended that you update all reinstalled software. Depending on the settings you used on your former configuration, some software may have been automatically updated without your knowledge. Use the following update procedures as soon as the computer is connected to the Internet.

To access update links for the operating system and other software provided on the computer, visit the HP website at [http://www.hp.com](http://www.hp.com) and click the software and drivers download link.

To update optional software, follow the instructions included with the software. Many applications include an update feature that you can access from a Help button or menu item within the application.
14 Routine Care

Hardware maintenance

The computer is designed for durability and long operating life. Follow the routine care guidelines described in this chapter to extend the life of the computer and maintain its peak performance.

- Carry and store the computer in a portable carrying case.

  ![CAUTION](image)

  To reduce the risk of damage to the display, do not place anything on top of the computer, even when it is in the carrying case.

- Avoid exposing the computer to direct sunlight, extreme temperatures, or ultraviolet light for extended periods.

  ![CAUTION](image)

  Do not expose the computer or drives to temperature or humidity extremes.

- Keep the computer clean. Dust buildup can raise the temperature of internal components.

  ![WARNING](image)

  To avoid potential discomfort or burns, do not block the air vents or use the computer on your lap for extended periods. The computer is designed to run demanding applications at full power. As a result of increased power consumption, it is normal for the computer to feel warm or hot when used continuously. The computer complies with the user-accessible surface temperature limits defined by the International Standard for Safety of Information Technology Equipment (IEC 60950).

  ![CAUTION](image)

  To reduce the risk of electric shock or damage to the computer:

  Always disconnect the computer from the AC outlet and disconnect peripherals from the computer before attempting to clean the computer or any of its components.

  Do not spray liquids on the computer keyboard, display, or drives, or allow liquids to drip onto them.

  ![CAUTION](image)

  To prevent overheating, do not obstruct vents. Use the computer only on a hard, flat surface. Do not allow another hard surface, such as a printer, or a soft surface, such as pillows, thick rugs, or clothing, to block the airflow.
Battery pack

⚠️ **WARNING!** To avoid potential safety issues, use only the battery pack provided with the computer, a replacement battery pack provided by HP, or a compatible battery pack purchased as an accessory from HP.

⚠️ **CAUTION** To prevent damage to a battery pack, do not expose it to high temperatures for extended periods of time.

If a computer will be unused and disconnected from external power for more than 2 weeks, remove the battery pack and store it separately.

To prolong the charge of a stored battery pack, place it in a cool, dry place.

Calibrate a battery pack before using it if it has been stored for one month or more.

### Disposing of a used battery pack

⚠️ **WARNING!** When a battery pack has reached the end of its useful life, do not dispose of the battery pack in general household waste. Follow the local laws and regulations in your area for computer battery pack disposal.

In Europe, dispose of or recycle the battery packs by using the public collection system or by returning them to HP, your service partner, or their agents.

⚠️ **WARNING!** To reduce the risk of fire or burns, do not disassemble, crush, or puncture a battery pack; short the external contacts on a battery pack; or dispose of a battery pack in fire or water. Do not expose a battery pack to temperatures above 60°C (140°F).
**TouchPad and keyboard**

Dirt and grease on the TouchPad can cause the pointer to jump around on the screen. To avoid this, clean the TouchPad with a damp cloth, and wash your hands frequently when using the computer.

⚠️ **WARNING!** To reduce the risk of electric shock or damage to internal components, do not use a vacuum cleaner attachment to clean the keyboard. A vacuum cleaner could deposit household debris on the keyboard surface.

Clean the keyboard regularly to prevent keys from sticking and to remove dust, lint, and particles that can become trapped beneath the keys. A can of compressed air with a straw extension can be used to blow air around and under the keys to loosen and remove debris.

If the computer keyboard includes a pointing stick, you may need to periodically clean or change the replacement cap. (Replacement caps are included with select models.)

**Display**

To remove smudges and lint, frequently clean the display with a soft, damp, lint-free cloth. If the screen requires additional cleaning, use premoistened antistatic wipes or an antistatic screen cleaner.

⚠️ **CAUTION** To prevent permanent damage to the computer, never spray water, cleaning fluids, or chemicals on the display.
Drives are fragile components that must be handled carefully. Follow the guidelines in this section to protect the drives.

⚠️ **CAUTION** To reduce the risk of damage to the computer, damage to a drive, or loss of information, observe these precautions:

- Before handling a drive, discharge static electricity by touching the unpainted metal surface of the drive.
- Do not touch the connector pins on a removable drive or on the computer.
- Handle a drive carefully; do not drop or compress the drive.
- Do not use excessive force when inserting a drive into a drive bay.
- Do not type on the keyboard or move the computer while the drive is writing to a medium. The write process is sensitive to vibration.
- When the battery pack is the only source of power, ensure that the battery pack is sufficiently charged before writing to a medium.

### Using Disk Defragmenter

As you use the computer, the hard disk files become fragmented. Disk Defragmenter consolidates the fragmented files and folders on the hard disk so that it can run more efficiently.

To run Disk Defragmenter:

1. Select **Start** > **All Programs** > **Accessories** > **System Tools** > **Disk Defragmenter**.
2. Click a volume, and then click **Defragment**.

For additional information, access the Disk Defragmenter online Help.

### Using Disk Cleanup

Disk Cleanup searches the hard disk for unnecessary files that you can safely delete to free up disk space and help the computer to run more efficiently.

To run Disk Cleanup:

1. Select **Start** > **All Programs** > **Accessories** > **System Tools** > **Disk Cleanup**.
2. Follow the instructions on the screen.
Regular tune-ups

To keep the computer hardware and software running like new, perform these simple tasks periodically.

- **Install and/or update the antivirus software.** Protect against current security threats to the computer by installing antivirus software. Keep the antivirus software up to date to protect against the ongoing threat of new viruses.

- **Install and update software that detects and removes spyware.** Spyware tools allow you to detect and prevent electronic encroachment into the computer system by outside parties.

- **Enable service reminders.** Subscriber’s Choice is a free service that allows you to receive instant e-mail notification about product updates, software drivers, and creative ideas to help you get more out of the computer.

- **Create a backup strategy.** A virus or an electrical outage could damage or destroy your information. Back up your files onto a CD-RW, DVD+RW, or USB drive to protect the security of your files.

- **Create a restore point.** In the event of a computer problem, these benchmarks allow you to go back in time to a point before the computer encountered a problem.

- **Create a PC tune-up schedule.** Create weekly and monthly reminders to back up files, update virus software, and perform hardware and software maintenance.
Traveling and shipping

The computer is built to go with you for work and play. For best results, follow the traveling and shipping tips described here.

- To prepare the computer for traveling or shipping:
  a. Back up your information.
  b. Remove all optical discs and all external media cards, such as PC Cards, Secure Digital (SD) Memory Cards, ExpressCards, and so on.
  
  **CAUTION** To reduce the risk of damage to the computer, damage to a drive, or loss of information, remove the medium from a drive before removing the drive from a drive bay, and before shipping, storing, or traveling with a drive.
  c. Turn off and then disconnect all external devices.
  d. Shut down the computer.
  
  - Take along a backup of your information. Keep the backup separate from the computer.
  - When traveling by air, carry the computer as hand luggage, and do not check it in with the rest of your bags.
  
  **CAUTION** Avoid exposing a drive to magnetic fields. Security devices with magnetic fields include airport walk-through devices and security wands. The airport security devices that check carry-on luggage, such as conveyor belts, use x-rays instead of magnetism and will not damage a drive.
  - If you plan to use the computer during a flight, check with the airline in advance. In-flight computer use is at the discretion of the airline.
  - If the computer will be unused and disconnected from external power for more than 2 weeks, remove the battery pack and store it separately.
  - If you are shipping the computer or a drive, place it in a bubble-pack mailer or other suitable protective packaging and label the package “FRAGILE.”
  - If the computer has a wireless device or a cell phone device installed, such as an 802.11 b/g, a Global System for Mobile Communications (GSM), or a General Packet Radio Service (GPRS) device, the use of these devices may be restricted in some environments. Such restrictions may apply aboard airplanes, in hospitals, near explosives, in hazardous locations, and so on. If you are uncertain of the policy that applies to the use of a particular device, ask for authorization to use it before you turn it on.
  - If you are traveling internationally:
    - Check the computer-related customs regulations for each country on your itinerary.
    - Consult with Customer Care about power cord and adapter requirements for each location in which you plan to use the computer. Voltage, frequency, and plug configurations vary.

  **WARNING!** To reduce the risk of electric shock, fire, or damage to the equipment, do not attempt to power the computer with a voltage converter kit sold for appliances.
Quick checklist

If you experience computer problems, follow the troubleshooting steps below:

1. Refer to the information in this section.
2. Access additional information about the computer and Web site links through the Help and Support Center.

   **NOTE** Although many checkup and repair tools require an Internet connection, other tools can help you fix a problem when the computer is offline.

3. Contact Customer Care for any further assistance. Refer to the "Customer Care" section in this chapter.

The computer will not start up.

To turn on the computer, press the power button. When the computer is turned on, the power light is turned on.

If the computer and the power light are not turned on when you press the power button, adequate power may not be available to the computer.

The suggested actions below may help you determine the reason the computer will not start up:

- If the computer is plugged into an AC outlet, verify that the AC outlet is providing adequate power by plugging another electrical device into the outlet.

- If the computer is running on battery power or is plugged into an external power source other than an AC outlet, plug the computer into an AC outlet using the AC adapter. Make sure the power cord and AC adapter connections are secure.

- If the computer is running on battery power:
  - Remove the primary battery pack and travel battery pack (if applicable) and plug the computer into an AC outlet using the AC adapter. If the computer starts up, one of the battery packs may need to be replaced.
  - If the battery light on the front of the computer is blinking, the battery pack has reached a low-battery condition, which may not allow the computer to start up. Plug the computer into an AC outlet using the AC adapter to start the computer and allow the battery to charge.
The computer screen is blank.

If you have not turned off the computer but the screen is blank, the computer may be in standby or hibernation, may not be set to display the image on the computer screen, or the display switch or ambient light sensor (select models only) may not be functioning properly.

The suggested actions below may help you determine the reason the computer screen is blank.

- To resume from standby or restore from hibernation, briefly press the power button.

  Standby and hibernation are energy-saving features that can turn off the display. Standby and hibernation can be initiated by the system while the computer is in Microsoft® Windows® but is not in use or has reached a critical low-battery condition. To change these and other power settings, select Start > Control Panel > Performance and Maintenance > Power Options.

- To transfer the image to the computer screen, press fn+f4.

  On most models, when an optional external display device, such as a monitor, is connected to the computer, the image can be displayed on the computer screen or the external display, or on both devices simultaneously. When you press fn+f4 repeatedly, the image alternates among the computer display, one or more external display devices, and simultaneous displays on all devices.

- Press the display switch on the computer to confirm that it moves freely.

- If the computer has a magnetic display switch (select models only), be sure that the computer is not near a strong magnetic field and that no magnetized items (for example, a magnetized screw driver) are laying on the computer.

- If the computer has an ambient light sensor (select models only), make sure that the sensor is not obstructed.

The software is functioning abnormally.

If the software becomes unresponsive or responds abnormally:

- Restart the computer:
  - In Windows XP Home, select Start > Turn Off Computer > Restart.
  - In Windows XP Professional, select Start > Turn Off Computer > Restart > OK. (The Turn Off Computer button may be called the Shut Down button, depending on the network connection.)

    If you cannot restart the computer using these procedures, refer to the next section, "The computer is turned on, but is not responding."

- Run a virus scan.

- If the computer feels unusually warm, allow it to cool to room temperature. For more information about computer overheating, refer to “The computer is extremely warm.” later in this chapter.

- If you are using an optional wireless mouse, make sure that the mouse battery has an adequate charge.
The computer is turned on, but is not responding.

If the computer is turned on, but is not responding to software applications or keyboard commands, try first to shut down the computer through the operating system by selecting Start > Turn Off Computer > Turn Off. (In Windows XP Professional, the Turn Off Computer button may be called the Shut Down button, depending on the network connection.)

If the computer remains unresponsive, try the emergency shutdown procedures in the following sequence:

1. If the computer is in Windows, press ctrl+alt+delete. Then, select Shut Down > Turn Off.
2. If you cannot shut down the computer by using ctrl+alt+del, press and hold the power button for at least 5 seconds.
3. If you are unable to shut down the computer by using the power button, unplug the computer from external power and remove the battery pack.

NOTE If you cannot turn the computer back on after shutting it down, refer to "The computer will not start up."

The computer is extremely warm.

It is normal for the computer to feel warm to the touch while it is in use. But if the computer feels extremely warm, it may be overheating because a vent is blocked.

If you suspect that the computer is overheating, allow the computer to cool to room temperature. Then be sure to keep all vents free from obstructions while you are using the computer.

CAUTION To prevent overheating, do not obstruct vents. Use the computer only on a hard, flat surface. Do not allow another hard surface, such as a printer, or a soft surface, such as a pillow or a thick rug or clothing, to block airflow.

An external device is not working.

If an external device does not function as expected:

- Turn on the device as instructed in the device user guide. Some devices, such as monitors and printers, may not be powered by the computer, and must be turned on before the computer is turned on.
- Verify that
  - All device connections are secure.
  - The device is receiving electrical power.
  - The device, especially if it is an older one, is compatible with the operating system. For compatibility information, refer to the Web site of the device manufacturer.
  - The correct drivers are installed and updated. Drivers may be available on a CD included with the device or on the Web site of the device manufacturer.
The computer cannot connect to a wireless local area network (WLAN).

If the computer cannot connect to a WLAN:

- Verify that the computer is within optimal range of a wireless router (access point).
- Verify that the wireless light on the computer is turned on.
- Verify that the computer wireless antennae are free from obstructions.
- Verify that the wireless router and broadband modem are working correctly.
Customer Care

If you are unable to find the help you need by using the Help and Support Center, you may need to contact Customer Care.

Preparing to contact Customer Care

For the fastest possible resolution of your problem, have the computer and the following information available when you call or e-mail:

- Product name located on the display or keyboard.
- Serial number (S/N) listed on the service tag.
  - The service tag label is on the bottom of the computer.
  - To display the service tag information on the computer screen, click My Computer in the Help and Support Center.
- Date the computer was purchased.
- Conditions under which the problem occurred.
- Error messages that have been displayed.
- The manufacturer and model of a printer connected to the computer.
- Operating system version number and registration number.

To display the operating system version number and registration number, click My Computer in the Help and Support Center. (On some models, the registration number may be identified in the Operating System table as the Product Id).

Contacting Customer Care by e-mail or telephone

If the computer is connected to the Internet, you can get help by e-mail or access Customer Care telephone numbers through the Help and Support Center.

Taking the computer to a service partner

If Customer Care advises you to take the computer to a service partner, be sure to provide the service partner with the information listed in "Preparing to contact Customer Care," earlier in this section. In addition, be sure to delete all passwords or to disclose all passwords to the service partner so that they can access the computer.
Electrostatic discharge is the release of static electricity when two objects come into contact—for example, the shock you receive when you walk across the carpet and touch a metal door knob.

A discharge of static electricity from fingers or other electrostatic conductors may damage electronic components. Before handling electrostatic-sensitive components, discharge static electricity by using one of the methods described in this chapter.

Handling drives

CAUTION To prevent damage to the computer, damage to a drive, or loss of information, observe these precautions:

Before handling the drive, discharge static electricity by touching the unpainted metal surface of the drive.

Do not touch the drive connector pins on the drive or on the computer.

Handling internal components

For best results when handling internal components, have everything needed for the installation within reach so that you do not need to leave the area after beginning the procedure. If you must leave the area during the procedure, remember to reground yourself before resuming the procedure.

CAUTION To prevent damage to the computer when you are removing or installing internal components, observe these precautions:

Keep components in their electrostatic-safe containers until you are ready to install them.

Use nonmagnetic tools.

Before touching an electronic component, discharge static electricity by using one of the grounding methods described in this chapter.

Avoid touching pins, leads, and circuitry. Handle electronic components as little as possible.

If you remove a component, place it in an electrostatic-safe container.
Grounding methods

If removal or installation instructions direct you to unplug the computer, unplug it after being properly grounded and before removing a cover. Use one or both of the following grounding methods:

- Touch the exterior unpainted metal surface of a device that is connected to an electrical outlet by a grounding plug.
- Use a wrist strap connected by a ground cord to the computer chassis. Wrist straps are flexible grounding straps with a minimum of one megohm ±10 percent resistance in the ground cords. To provide proper ground, wear the strap snugly against your skin.

If you need more information about static electricity or assistance with component removal or installation, contact Customer Care.
