

TREND WATCH

What is the right sourcing option for my data center?

When considering data center design and sourcing, today's IT managers have several options. Typically, these fall into three categories:

- Containerized data centers, such as pods
- Industrialized data centers
- Traditional, customized data centers

Making the right choices regarding sourcing is critical. Your decisions should focus on issues such as energy efficiency, automation, virtualization, consolidation, and business continuity. In addition, you should be able to understand and predict your technology needs for the coming 10–15 years—which is not always an easy task.

Key strategic decisions may also include whether it is best for you to build, lease, outsource, co-locate, or implement pods; what the optimum number of sites is and where they should be located; and what tier levels provide the best balance between availability and cost.
