HP OpenView Performance Agent for Solaris
HP OpenView GlancePlus for Solaris
HP OpenView GlancePlus PAK for Solaris

Information and objectives of this release are:

This release applies to the following Operating Systems:

- Solaris 9
- Solaris 8 Update
- Solaris 8 and
- Solaris 7

Process argument enhancements provide great new flexibility to define applications according to arbitrary string matches from process command strings and arguments. Glance and OVPA will both take advantage of these new application definition enhancements in the parm file. Glance process reports will show the command and argument strings, and OVPA will log the first argument metric as well. The value of the first argument metric for java processes can be replaced by the class or jarfile name using a parm file switch. Unlike other approaches, the OVPA method will avoid excessive overhead on busy systems. These changes represent a significant value to you our customer.
