

November, 2011

Dear valued customer,

Please be advised that HP has upgraded the default version of Symantec products to 5.0.1 in all the HP-UX 11i v3 Operating Environments starting with the September 2011 HP-UX 11i v3 update. The default Symantec version has met HP test and continuous usage criteria.

Specifically, the default installation of the September 2011 11i v3 update will result in VxFS 5.0.1 running over LVM. Base-VxFS continues to be the default file system for the BOE (Base Operating Environment – BA927AA), while HP OnlineJFS 5.0.1 is the default for:

- Virtual Server Environment – BA929AA
- High Availability Operating Environment – BA930AA
- Data Center Operating Environment – BA931AA

A purchase of the HP-UX 11i v3 Operating Environments includes rights to use the default component product versions tested/qualified/delivered with the OE Bundle at time of purchase. Customers who have valid OE support contracts are entitled to use newer versions of the OE components.

The most recent version of OnlineJFS is 5.1. Access is provided through the Software Updates Service. Download is located with each Operating Environment download (BA929AA, BA930AA or BA931AA) on the [Software Updates and Licensing](#) portal. Delivery on physical media may be requested as required.

OnlineJFS 5.0.1 (B3929GB/GBE) and OnlineJFS 5.1 (B3929HB/HBE) are available for separate order. Please be aware that end of sale for OnlineJFS 5.0 is planned for 26 March, 2012.

For further clarification, please contact your local HP representative.
