The work world is evolving once again as more companies are looking to have people return to the office. However, this trend is not occurring uniformly across all industries or regions. As workplaces are redesigned to accommodate the wants and needs of the new hybrid workforce, technology will be a vital component in helping people connect and engage in more meaningful ways. It will be the cornerstone for building a seamless experience for both remote and in-office workers.

**Trend 01** Tech that’s more human—by design

As more companies engage in cross-country telecommuting and remote work, the need to respect and connect with colleagues during video conferencing becomes even more critical. The importance of making technology more human will be key. Here are some ways to ensure that technology offers the same level of engagement as a face-to-face meeting:

- **Microphones that automatically adjust so everyone is heard at the same volume.**
- **Dynamic noise-canceling audio.**
- **AI that keeps the focus on everyone.**
- **Scalability that maintains strict security protocols.**
- **Doesn’t require additional software for end users.**
- **Doesn’t restrict access for remote workers.**
- **Scales to room size without complex reconfiguration.**

HP offers planning, tools, and expertise of Poly engineers into our extensive range of audio and video solutions.
